

SAP BTP: FROM IDEAS TO APPLICATIONS

Old Way

Custom work lived in the core

Teams filled process gaps with custom code, spreadsheets, disconnected tools, and manual handoffs. It worked for a while, but change got harder.

Next Step

Find the right app faster

SAP BTP helps teams build side-by-side apps and extensions while keeping the ERP core cleaner, easier to maintain, and better prepared for future change.

Key Shift

Connect the work

Integrations, APIs, and events help SAP and third-party tools share data and trigger action, so work does not get stuck between applications or teams.

Foundation

Apps, data, and AI

SAP BTP brings app development, automation, integration, data, analytics, and AI together, with tools built around SAP business processes.

SAP Build

Build practical apps

Teams can use SAP Build to create apps, workflows, and digital workspaces that fit real business needs, without starting every project from scratch each time.

Business Value

Faster change, less complexity

The goal is faster change with less complexity: governed apps, automations, and extensions that support daily work and future AI use cases inside ERP.
